

MANUFACTURING

server architecture and legacy systems

High Volume Printer

The challenge

A high-volume bulk-mail printer needed to upgrade their server infrastructure, however their business runs a specialized planning and accounting package which limited their choices for server upgrades.

What we did

navitend architected and deployed a virtualized server platform which enabled a smooth "physical to virtual" conversion of their legacy server.

The result

By virtualizing this server we have been able to enable continual operations for this client and even perform simple "upgrades" from time to time by making configuration changes to their virtual environment.

Talk to a person, not a ticket

Tell us what's going on. We'll listen, ask good questions, and give you a straight answer about whether we can help.
